

ABSTRACT OF THE DISCLOSURE

A technology prevents an operational mistake and reduces a labor and a time necessary for the operation in a system which a repetition of the same or similar
5 operation steps is required of. An information processing system includes a first storage module storing step information containing parameters, a second storage module storing values of the parameters, and a module
executing steps specified by the step information in a
10 way that replaces a parameter of the step information with a value of the parameter.
